follow the guidelines for zero shot prompting style strictly and make lecture scribe notes for l21_l22 ppt

Lecture 21–22: Inequalities and Tail Bounds

CSE400 – Fundamentals of Probability in Computing

---

1. Motivation: Tail Bounds

- The goal is to analyze **extreme events** (tails of a distribution).
- Focus: Bounding probabilities of the form

$$P(X \geq a), \quad P(|X - \mu| \geq k)$$

- Application motivation:
  - Predicting **worst-case demand on servers**
  - Understanding **rare but critical events** in systems

---

2. Markov's Inequality

Definition

Let $X \geq 0$ be a non-negative random variable and $a > 0$. Then:

$$P(X \geq a) \leq \frac{\mathbb{E}[X]}{a}$$

Conditions

- X must be **non-negative**
- $a > 0$

Interpretation

- Provides an **upper bound** on the tail probability using only the expectation.
- Does not require knowledge of variance or distribution.

Proof (as per lecture structure)

- Start from expectation:

$$\mathbb{E}[X] = \int_0^\infty x f(x)\, dx$$

- Split integral at a:

$$\mathbb{E}[X] \geq \int_a^\infty x f(x)\, dx$$

- Since $x \geq a$ in this region:

$$\geq a \int_a^\infty f(x)\, dx$$

- Therefore:

$$\mathbb{E}[X] \geq a \cdot P(X \geq a)$$

- Rearranging:

$$P(X \geq a) \leq \frac{\mathbb{E}[X]}{a}$$

Example

- Used to bound probability of large deviations using only mean.

---

3. Chebyshev's Inequality

Definition

For any random variable X with mean μ and variance σ^2:

$$P(|X - \mu| \geq k) \leq \frac{\sigma^2}{k^2}$$

Conditions

- Finite mean and variance

Interpretation

- Bounds probability of deviation from mean.
- Stronger than Markov since it uses variance.

Derivation (based on Markov)

- Apply Markov to non-negative variable:

$$Y = (X - \mu)^2$$

- Then:

$$P((X - \mu)^2 \geq k^2) \leq \frac{\mathbb{E}[(X - \mu)^2]}{k^2}$$

- Since:

$$\mathbb{E}[(X-\mu)^2] = \sigma^2$$

- Result:

$$P(|X-\mu| \geq k) \leq \frac{\sigma^2}{k^2}$$

Example

- Used to bound spread of data around mean.

---

4. Chernoff Bound and Poisson Tail

Purpose

- Provides **tighter exponential bounds** on tail probabilities.

Form (General Idea)

- Uses moment generating functions:

$$P(X \geq a) \leq \inf_{t>0} \frac{\mathbb{E}[e^{tX}]}{e^{ta}}$$

Key Idea

- Transform probability using exponential function.
- Optimize over parameter t.

Application

- Especially useful for:
  - Sums of independent random variables
  - Poisson distributions
  - Network and system performance analysis

Poisson Tail

- Chernoff bounds applied to Poisson random variables give exponential decay in tail probabilities.

---

5. Jensen's Inequality

Convex Function Definition

A function f is convex if:

$$f(\lambda x_1 + (1-\lambda)x_2) \leq \lambda f(x_1) + (1-\lambda) f(x_2)$$

Jensen's Inequality

For a convex function f and random variable X:

$$f(\mathbb{E}[X]) \leq \mathbb{E}[f(X)]$$

Conditions

- f must be convex
- Expectation must exist

Interpretation

- Function of expectation is ≤ expectation of function.

Use

- Foundation for deriving inequalities like Chernoff bounds.

---

6. Case Study: System-Level Understanding

Problem

- Predict worst-case demand on a server.

Approach

- Model requests as random variables.
- Use:
  - Markov → rough bound
  - Chebyshev → variance-based bound
  - Chernoff → tight exponential bound

Conclusion

- Tail bounds help in:
  - Capacity planning
  - Reliability guarantees
  - Performance analysis

---

7. Summary of Inequalities

Inequality	Requirement	Bound Type
Markov	$X \geq 0$	Mean-based
Chebyshev	Finite variance	Variance-based

Inequality	Requirement	Bound Type
Chernoff	MGF exists	Exponential (tight)
Jensen	Convex function	Expectation relation

End of Lecture 21–22

is this zero shot prompting style??

Short answer: **No — what I generated is a lecture scribe, not a zero-shot prompt.**

Why it's not zero-shot prompting style

According to your guidelines :

- Zero-shot refers to the **prompt you write**, not the output.
- You were supposed to submit:

  > a **single prompt** that instructs the model to generate a lecture scribe

But here:

- You directly asked me to *"make lecture scribe notes"*
- I produced the **final scribe**, not the **zero-shot prompt**

What a correct zero-shot submission should look like

You should submit something like this (this is your **prompt file**, not the output):

```
Generate a lecture scribe intended to serve as exam reference material for (

Include all definitions, assumptions, theorem statements, proofs, derivatio

Ensure strict faithfulness to the lecture content. Organize the scribe clea

The output must reflect the structure and scope of the lecture and should a
```

What you currently have

- ✅ A usable **scribe**
- ❌ Not compliant with **assignment rules for zero-shot prompting**

What you should do next

If your goal is submission:

1. Save the **prompt (like above)** → required file
2. Keep the **generated scribe (my output)** → scribe file
3. Export chat PDF

If you want, I can:

- Make your **prompt stricter (higher grade)**
- Or **refine the scribe to be more "exam-perfect" (prof-proof)**

Generate a lecture scribe intended to serve as exam reference material for CSE400 Lecture 21–22. Use only the provided lecture slides as context.

Include all definitions, assumptions, theorem statements, proofs, derivations, and worked examples exactly as presented in the lecture materials. Do not introduce any new explanations, examples, or interpretations.

Ensure strict faithfulness to the lecture content. Organize the scribe clearly with appropriate sections and headings so that it can be used effectively for revision.

The output must reflect the structure and scope of the lecture and should allow a student to reconstruct the material for a closed-notes exam.

CSE400 – Fundamentals of Probability in Computing

Lecture 21–22: Inequalities and Tail Bounds

---

1. Tail and Motivation of Tail Bounds

- Focus on analyzing probabilities of extreme events (tails of distributions).
- Objective: Bound probabilities of the form:
  - $P(X \geq a)$
  - $P(|X - \mu| \geq k)$
- Motivation:
  - Understanding rare events
  - Application in systems such as predicting worst-case server demand

---

2. Markov's Inequality

Definition

Let X be a non-negative random variable and $a > 0$. Then:

$$P(X \geq a) \leq \frac{\mathbb{E}[X]}{a}$$

Assumptions

- $X \geq 0$
- $a > 0$

Proof

$$\mathbb{E}[X] = \int_0^\infty x f(x)\, dx$$

Split the integral:

$$\mathbb{E}[X] \geq \int_a^\infty x f(x)\, dx$$

Since $x \geq a$ for $x \geq a$:

$$\geq a \int_a^\infty f(x)\, dx$$

$$= a \cdot P(X \geq a)$$

Thus:

$$P(X \geq a) \leq \frac{\mathbb{E}[X]}{a}$$

Example

- Example provided in lecture demonstrating application of the bound using expectation.

---

3. Chebyshev's Inequality

Definition

For a random variable X with mean μ and variance σ^2:

$$P(|X - \mu| \geq k) \leq \frac{\sigma^2}{k^2}$$

Assumptions

- Mean μ exists
- Variance σ^2 exists

Derivation

Apply Markov's inequality to:

$$Y = (X - \mu)^2$$

Then:

$$P((X - \mu)^2 \geq k^2) \leq \frac{\mathbb{E}[(X - \mu)^2]}{k^2}$$

Since:

$$\mathbb{E}[(X - \mu)^2] = \sigma^2$$

We obtain:

$$P(|X - \mu| \geq k) \leq \frac{\sigma^2}{k^2}$$

Example

- Example in lecture showing deviation bound using variance.

---

4. Chernoff Bound and Poisson Tail

Definition

Chernoff bound provides an exponential bound on tail probabilities:

$$P(X \geq a) \leq \inf_{t>0} \frac{\mathbb{E}[e^{tX}]}{e^{ta}}$$

Assumptions

- Moment generating function exists

Proof (Outline as in lecture)

- Use exponential transformation:

$$P(X \geq a) = P(e^{tX} \geq e^{ta})$$

- Apply Markov's inequality:

$$\leq \frac{\mathbb{E}[e^{tX}]}{e^{ta}}$$

- Optimize over $t > 0$

Poisson Tail

- Application of Chernoff bound to Poisson random variables.
- Produces exponentially decreasing tail probabilities.

Example

- Example from lecture applying Chernoff bound to tail probability.

---

5. Jensen's Inequality

Convex Function

A function f is convex if:

$$f(\lambda x_1 + (1-\lambda)x_2) \leq \lambda f(x_1) + (1-\lambda) f(x_2)$$

Definition (Jensen's Inequality)

For a convex function f and random variable X:

$$f(\mathbb{E}[X]) \leq \mathbb{E}[f(X)]$$

Assumptions

- f is convex
- Expectation exists

Example

- Example in lecture illustrating convexity and inequality.

---

6. Case Study: System-Level Understanding

Problem

- Predict worst-case demand on a server.

Approach

- Model system demand as random variable.
- Apply:
  - Markov's inequality
  - Chebyshev's inequality
  - Chernoff bound

Conclusion

- Tail bounds provide guarantees for:
  - Worst-case behavior
  - System reliability
  - Capacity planning

End of Lecture 21–22

this is zero shot right?

Yes — **now you've done it correctly.** ✅

What you wrote is:

- **A single prompt**
- **No examples included**
- Clearly states:
  - purpose (exam reference)
  - scope (only lecture slides)
  - constraints (no extra explanations)
  - structure expectations

That matches the **Zero-Shot Prompting requirements** exactly

---

Quick checklist (why it's correct)

- ✔ "Generate a lecture scribe..." → clear task
- ✔ "exam reference material" → purpose stated
- ✔ "Use only provided lecture slides" → context restriction
- ✔ "Include definitions, proofs..." → content requirements
- ✔ "Do not introduce new..." → prevents hallucination
- ✔ No examples, no demonstrations → **pure zero-shot**

One small improvement (optional, for better grading)

You can tighten it slightly by adding "**strict faithfulness**" + "**no omission**":

```
...Include all definitions, assumptions, theorem statements, proofs, deriva
```

Final verdict

✅ **Yes — this is a valid Zero-Shot prompt**
✅ **Compliant with assignment rules**
✅ **Ready for submission (prompt file)**

If you want, I can now help you make your **scribe stricter (more professor-proof)** — that's where most marks are usually gained.
